

BROADBAND IN THE SKY WILL BE A \$130 BILLION MARKET BY 2035

News /

London School of Economics predicts airlines will generate an additional \$30 billion in incremental revenue

Airlines to benefit from significant revenue growth in broadband enabled e-commerce, advertising and premium content

Inflight broadband has the potential to create a \$130 billion global market within the next 20 years, resulting in \$30 billion of additional revenue for airlines by 2035. This is the conclusion of a first-of-its-kind research study, 'Sky High Economics: Quantifying the commercial opportunities of passenger connectivity for the global airline industry', carried out by London School of Economics and Political Science (LSE) in association with Inmarsat (LSE: ISAT.L), the world's leading provider of global, mobile satellite communications.

Market potential

Based on current IATA data and industry sources, Sky High Economics has developed an independent forecasting model. It predicts broadband enabled ancillary revenues for airlines will

come from four main revenue streams:

- Broadband access charges – providing connectivity to passengers inflight
- E-commerce and destination shopping – making purchases on-board aircraft with expanded product ranges and real-time offers
- Advertising – pay-per-click, impressions, sponsorship deals with advertisers
- Premium content – providing live content, on demand video and bundled W-IFEC access

Forecasted airline share of the \$30 billion broadband enabled ancillary revenue opportunity

	Broadband access	E-commerce	Advertising	Premium content	Total
2018	\$822 million	\$36 million	\$26 million	\$39 million	\$ 1 billion
2028	\$9 billion	\$3 billion	\$2.9 billion	\$731 million	\$15 billion
2035	\$15.9 billion	\$6.8 billion	\$6 billion	\$1.4 billion	\$30 billion

At present, only some 53 out of an estimated 5,000 airlines worldwide offer inflight broadband connectivity.i On the back of strong passenger demand, inflight internet will be ubiquitous on commercial aircraft by 2035. Currently, airlines receive an additional \$17 per passenger from ‘traditional’ ancillary services such as duty free purchases and inflight retail, food and drink sales. Broadband enabled connected ancillary revenues will add an extra \$4 by 2035.

Drivers for growth

Full service carriers look set to claim the lion’s share of airline revenues (63%), generating \$19 billion by 2035. Capitalising on longer flight times, additional revenue will come from the ability to maximise e-commerce platforms and striking deals with content providers to offer premium packages. The Sky High Economics study predicts low cost carriers will generate \$11 billion by 2035, the bulk of which will come from selling connectivity to passengers.

Regional differences

The research also identified that regionally, the greatest opportunity for broadband-enabled ancillary services is in Asia Pacific. Driven by passenger growth and availability of services, airlines in Asia Pacific will benefit from \$10.3 billion of ancillary revenues by 2035, followed by Europe (\$8.2 billion) and North America (\$7.6 billion).

Dr Alexander Grous (B. Ec, MBA, M.Com, MA, PhD.), Department of Media and Communications, LSE and author of Sky High Economics said: “The opportunity available to airlines is enormous. The Sky High Economics study predicts the creation of a \$130 billion market within the next two decades. Globally, if airlines can provide a reliable broadband connection, it will be the catalyst for rolling out more creative advertising, content and e-commerce packages. We will see innovative deals struck, partnerships formed and business models fundamentally changed for new players to lay claim to the \$100 billion opportunity away from airlines. Broadband-enabled ancillary revenue has the potential to shape a whole new market and it’s something airlines need to be planning for right now.”

Frederik van Essen, Senior Vice President Strategy & Business Development, Inmarsat Aviation, commented: “As airlines start to act more like retailers, they will realise the benefits of closing the inflight connectivity gap. Doing so will lead to unlocking \$15 billion per year in additional ancillary revenues within the next decade, one of the biggest sources of growth. The key to this potential and getting to the eventual \$30 billion revenues, is fast, high quality inflight internet that can be relied upon without drop-outs.”

Inmarsat is transforming the global aviation industry by bringing complete connectivity to every aircraft and flight path in the world. It is the first and only provider with a complete next-generation High-Throughput Satellite (HTS) network spanning the world. Inmarsat is also the only aviation broadband provider capable of connecting the complete aircraft from cabin to cockpit. Inmarsat's world-leading passenger solutions are complemented by its industry-standard certified safety and operations services. GX Aviation is the world's first global, high-speed inflight broadband service from a single operator. It allows airline passengers to browse the internet, stream videos, check social media and more during flights, with an on-board connectivity experience on par with mobile broadband services available on the ground.
